

Interactive Tools for UNESCO Sights Management

Interaktivní nástroj pro management památky UNESCO

Interactive Sights Management Tool

Combination of town complex 3D model, database links, present furniture installation and alternative models of benches, lamps and bins placed into 3D GIS system for making better decision on sights management.

GIS system allows join 3D spatial models with database in a municipality, National Heritage Institute and other institutions.

Compared to the complex model, where the buildings are very simplified, a precise model of each building is also progressively produced. The details and accuracy of the detailed model is a high priority and the model can be used for signboards and showcases installed on walls.

In GIS can be virtually installed many of types of street benches, lights, bins, kiosks, etc. and assess the suitability for historical centre of UNESCO places.
